

Ideation Phase Empathize & Discover

Date	25 August 2026
Project Name	Employee Raise Issue – Record Producer & Service Portal Integration
Maximum Marks	4 Marks

Empathy Framework & Target Stakeholder Core Context :

- **Target Core Persona:** A modern corporate professional operating within a matrixed enterprise infrastructure.
- **Operational Triggers:** Encounters functional workflow blockers that disrupt business velocity, including system access drops, payroll discrepancy anomalies, or urgent HR compliance queries.
- **Baseline Friction:** Currently constrained by legacy operational configurations, relying entirely on erratic communication silos like unmonitored personal emails or ad-hoc instant messages to surface incidents.
- **Strategic Objective:** This diagnostic model systematically evaluates the user's operational experiences, structural difficulties, and desired qualitative outcomes associated with the current unstandardized service layout.

THINK & FEEL

- Demands that workplace blockers are logged seamlessly without data loss.
- Expects to input required case fields without confusing text configurations.
- Needs the ticket to automatically route to the right support domain group.
- Desires instant visual indicators regarding live ticket progression phases.
- Fears that unmonitored mailbox messages might get completely overlooked.
- Requires the whole intake interface layout to be simple and frictionless.

HEAR

- "Draft a detailed text email and forward it to the main helpdesk inbox."
- "Please include all basic parameters when sending your query."
- "The technician team will review your incident history soon."
- "Reach out directly to the HR portal desk or system lead for updates."
- Different internal departments share contradicting methods for raising complaints.

SEE

- Unstructured personal emails and informal chats clogging the ticketing queue.
- Erratic, non-aligned channels used across varying departments for logging problems.
- Inconsistent request forms demanding completely different metrics from users.
- Total blind spots regarding the current status of a ticket once it enters the queue.
- A massive variety of enterprise problems spanning IT logins, salary mismatches, facilities, and policy queries.

Say Do

- Formulates free-text issue definitions over chat threads or manual email channels.
- Directly contacts HR or support engineers via instant messages for immediate attention.
- Supplies missing incident attributes only when prompted by follow-up queries.
- Continually tracks progress by sending status check-in emails when updates stall.

- Constantly looks for a single, uniform portal window to record workplace requests.

PAIN

- Absence of a single, standardized corporate service ingestion pathway.
- Severe ambiguity over what exact baseline context data must be submitted.
- Zero transparency and lack of automated tools to check real-time progress.
- Heavy delays caused by manual multi-hop communication and follow-up loops.
- Continuous confusion in identifying which specific team owns the logged problem.
- Risk of routing corrupted, incomplete, or highly inconsistent context data fields.

Gain.

- Structured, machine-readable capture of contextual issue attributes.
- Granular sorting taxonomy utilizing explicit Category classifications.
- Slashed operational resolution delays and enhanced process auditability.
- Complete termination of dependency on legacy inbox streams
- Faster, highly automated routing logic execution across enterprise queues.

User Need

The employee requires a frictionless, centralized digital intake gateway capable of enforcing structural data ingestion models, ensuring automated collection of mandatory properties while establishing 100% visibility into the ticket execution lifecycle.
