

Project Design Phase Solution Architecture

Date	25 August 2026
Project	Employee Raise Issue – Record Producer & Service Portal Integration
Marks	4 Marks

Solution Architecture

1. Solution Overview:

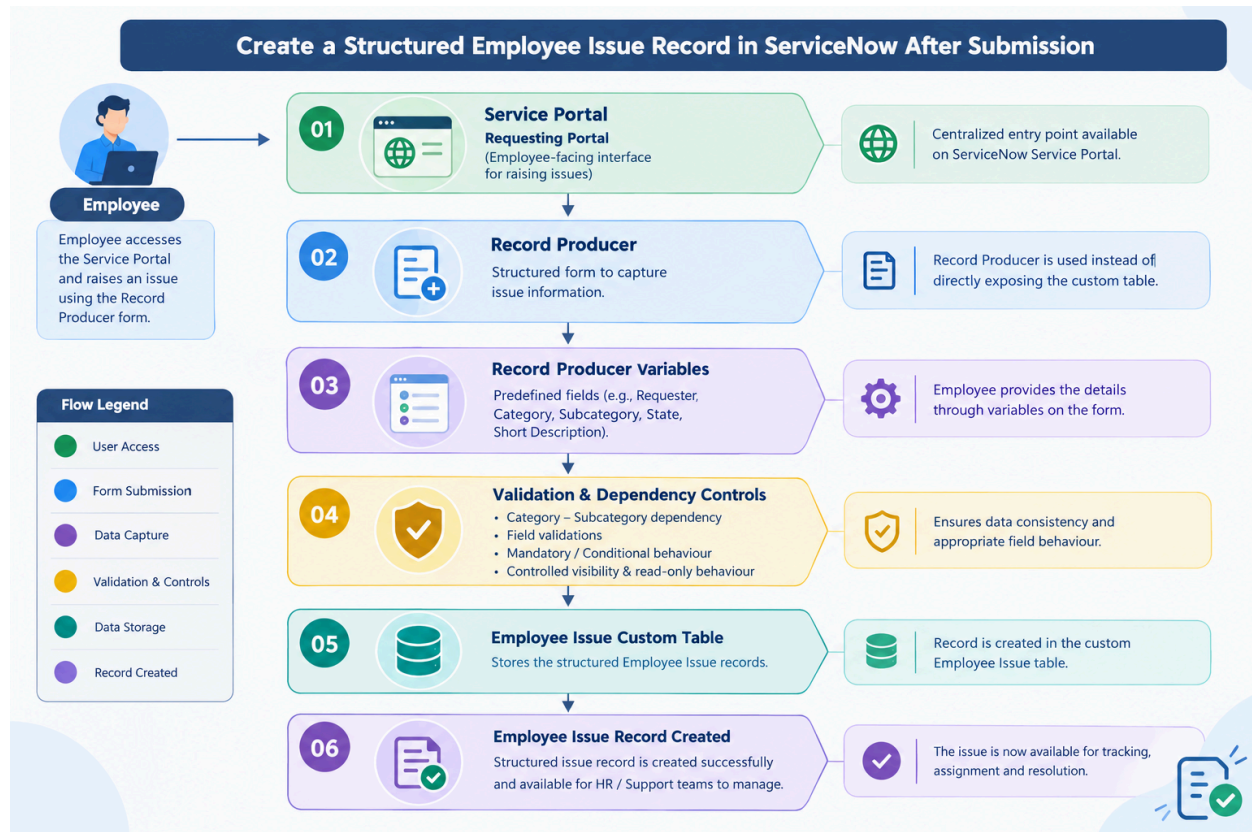

The proposed ServiceNow solution enables employees to report workplace-related issues through the Service Portal. A Record Producer is used to collect issue details through predefined variables without exposing the backend table directly.

The submitted information is validated and mapped to the appropriate fields in the custom Employee Issue table. Category–Subcategory dependencies and field validations help maintain accurate and consistent data.

2. Key Solution Goals

The solution aims to:

- Provide a simple interface for employees to report issues.
- Capture issue details using structured variables.
- Map submitted values to the Employee Issue table.
- Apply required validations and field controls.
- Maintain Category–Subcategory dependency.
- Automatically create a structured Employee Issue record after submission.

Solution Building Blocks

1. Solution Overview

The submitted information is validated and mapped to the appropriate fields in the Employee Issue Custom Table.

Input Data and Field Mapping

The Record Producer variables capture the information entered by the employee. These values are mapped to the appropriate fields in the **Employee Issue** table to ensure proper data storage.

2. Business Rules and Form Controls

ServiceNow configurations are used to control the form and maintain data accuracy. These include:

- Category–Subcategory dependency
- Mandatory field validation

- UI Policy-based field behaviour
- Conditional visibility
- Read-only controls

3. Backend Data Repository

Employee Issue Custom Table

The Employee Issue Custom Table stores the information submitted by employees through the Record Producer. The captured details are maintained in a structured format for further tracking and management.

4. Generated Issue Entry

Once the form is successfully submitted and validations are completed, ServiceNow creates an **Employee Issue record** containing the information provided by the employee

5. Request Processing Flow

Employee → Service Portal → Issue Form → Input Variables → Validation & Controls → Employee Issue Custom Table → Issue Record
