

Project Design Phase Proposed Solution

Date	25 August 2026
Project	Project Design Phase Proposed Solution
Marks	2 Marks

Suggested Implementation Approach :

S.No.	Aspect	Details
1	Need Identification	Establish a dedicated mechanism through which employees can register workplace concerns in a consistent and organized manner, reducing dependence on scattered communication methods
2	System Approach	Configure a ServiceNow-based employee support process where users can initiate a request from the Service Portal and provide the required information through a guided submission form.
3	Request Processing	Capture employee and issue-related details through predefined fields, apply appropriate validation, and control related selections before accepting the request.
4	Record Handling	Convert successfully submitted information into

		a structured Employee Issue record so that the request can be reviewed and managed within the ServiceNow environment.
5	Operational Advantage	Provide employees with a consistent reporting experience while giving administrative teams properly organized information for further processing and maintenance.
6	Implementation Benefit	Use the existing ServiceNow platform capabilities instead of introducing a separate application, database, or external processing system.
7	Enhancement Scope	Keep the implementation flexible enough to accommodate additional issue categories, departments, workflows, assignment rules, notifications, and other employee-support requirements in future phases.
